

Pilchuck River Bridge 581 Replacement – Project Update

Snohomish County Public Works plans to replace the Pilchuck River Bridge on 64th Street NE in 2016. The current bridge, built in 1960, is constructed of steel and timber with numerous support piers in the river. The proposed new bridge will be built using a steel truss design, which will eliminate the need for intermediate support piers. Crews will build the new bridge right next to the existing bridge so the existing bridge can remain in service while the new bridge is being built.

As of February 2015, the project design is 90 percent complete. Engineers expect to advertise the project for competitive construction bid in the summer or early fall of 2015. Construction is expected to begin in late spring or early summer 2016.
